

# Cancellations: Migrating Monday.com into the App

Unifying intake + returns tracking + final release into one record.

This document describes the current Monday.com cancellation process — split across three boards and ~1,100 active records — and proposes a unified replacement inside the DIX app. The plan is structured so you can read it once, redirect anything, and approve the parts you want before any code is written.

| SOURCE DATA | Monday board 9494905327 + 6983996664 + 6269744401 |

## Executive Summary

Cancellations today live in three Monday boards plus a stub in the DIX app. The boards cover the same conceptual lifecycle but in fragmented places — terminals submit a request in one board, ops processes returns in another, and a legacy department-by-department board hangs around from 2024. Most of the active work happens on "Cancellation Returns Tracking" (1,101 items), which is also the only board with a working agent submission form and equipment-tracking fields.

### Recommendation

- Make the DIX app the single source of truth. Absorb the full schema of "Cancellation Returns Tracking" — that is the canonical board.
- Replace 10 hardcoded equipment status columns with one relational sub-table — easier to add new equipment types and clearer reporting.
- Collapse intake + ops processing into one record with a status pipeline. No more "split into two places."
- Retire "Cancel Process" (legacy 2024) and "Cancellation Requests" (1 active item, vestigial). Keep "Cancellation Returns Tracking" read-only for 30 days as a fallback, then archive.
- Migrate the existing 1,101 records via a one-shot script so we do not lose history.

### Why this matters

Right now an agent in a terminal must remember which board to use, ops staff must keep two systems in sync, and there is no single record per cancellation. The redesign collapses everything into one wizard plus one Kanban board inside DIX, and replaces Monday automations (notify owner on submit, due-date math, equipment % progress) with deterministic flows we control.

#### Outcome

One DIX page replaces three Monday boards. Agents submit cancellations through the same wizard pattern they already use for new entries. Ops gets a Kanban view, an Equipment % progress bar, automatic due-date math, and a generated cancellation letter PDF — no Monday license required.

# Current state — three Monday boards

What I found when I crawled the IBE Services workspace:

## Cancellation Returns Tracking

Board 9494905327 · 1,101 active items · THE workhorse

59 columns, 8 status groups, 10 equipment columns each with a 9-state lifecycle, 6 dates, 9 formula columns, 4 time-tracking columns, an Agent Form for intake, and a "Send / Integration with DIX" button hinting this was always meant to flow into our app. This is the board that matters.

## Cancellation Requests

Board 6983996664 · 1 active item · vestigial intake

Older intake form (Sarah Reisker, 2024). Status pipeline: Requested !' Processed  
Moved to CXL or Forfeit. CXL CSR + Billing CSR people columns and a Pause Deductions board relation.  
Effectively superseded by the Returns Tracking form view.

## Cancel Process

Board 6269744401 · 1 active item · legacy department workflow

Older still (Rachel Sladin, 2024). Per-department status + rep + done-date for Safety, Inventory, ELD/Logs, Billing, Deductions, Accounting. Final Done Date populates by automation when all departments are Done.  
Useful conceptual reference, not in active use.

## What is in the DIX app today

The Dataverse table cr6cd\_dix\_cancellation exists but is sparse: name, reason, request date, notes, approved bool, amount, deduction date, driver lookup. The 4-step wizard (Details / Equipment / Final Release / Review) is built but the "New Cancellation" button is currently disabled with a "Coming Soon" badge. None of the equipment lifecycle, terminal, or status pipeline from Monday is represented yet.

## Pain points the redesign solves

### Two systems of record

Monday holds 1,101 records of truth; DIX holds a stub. Any field added to one drifts from the other. Cancellation status is invisible from the rest of the DIX driver record.

### 10 equipment columns × 9 states = 90 cells per row

Each equipment type is a separate Monday status column. Adding a new piece of equipment means adding a column to the board, a column to a formula, and another "Needed" formula. A relational sub-table makes this  $O(1)$ .

### Status lives in groups, not in a column

Monday models the pipeline by moving items between groups. That works in Monday but does not survive export. We need an explicit Status field.

### Notification logic is a kludge

Two columns ("Notify Trigger" + "Trigger Status") exist purely to fire automations. The column descriptions explicitly warn "do not remove this column." A real flow can do this without dummy state.

### No PDF letter, no email draft

Cancellation letters are written ad-hoc. The DIX app already generates 14 other PDFs via jsPDF — we extend that pattern.

# Proposed architecture

One record per cancellation in the DIX app, backed by three Dataverse tables. Two new sub-tables capture the relational data Monday represented as columns.

## Tables

| Table                               | Role          | Notes                                             |
|-------------------------------------|---------------|---------------------------------------------------|
| cr6cd_dix_cancellation (existing,   | Master record | One row per cancellation. Holds identity, status, |
| cr6cd_dix_cxl_equipment (NEW)       | Sub-table     | One row per piece of equipment per cancellation.  |
| cr6cd_dix_cxl_event (NEW, optional) | Audit log     | One row per state transition. Replaces Monday's   |

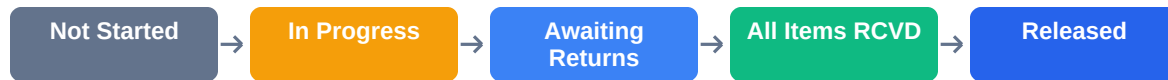

## Wizard restructure

Today: 4 steps, all "ops" oriented. Proposed: 5 steps, with a clean break between intake and processing — same pattern as the New Entry wizard.

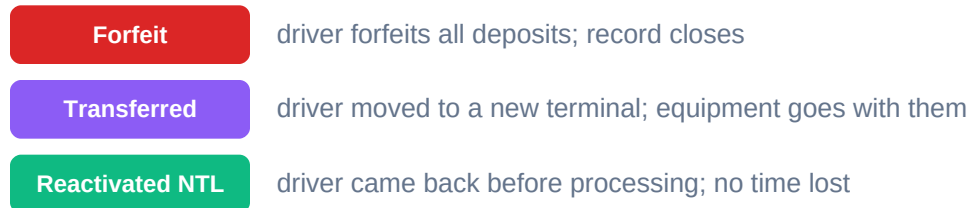

| Step                  | Owner           | Purpose                                                             |
|-----------------------|-----------------|---------------------------------------------------------------------|
| 1. Submit Request     | Terminal CSR    | Type, terminal, driver/vendor/unit info, cancel date, reason.       |
| 2. Equipment Required | Auto + Ops      | Auto-derives Need vs N/A from cancellation Type, ops can            |
| 3. Returns Tracking   | Ops (Inventory) | Lifecycle status of each piece (Need / Returned / Damaged / Forfeit |
| 4. Final Release      | Ops             | Last item received, deposits, forfeit, tentative release date =     |
| 5. Review & Documents | Ops             | Generate cancellation letter PDF, create email draft via Power      |

## Status pipeline (single column, replaces 8 groups + 3 columns)

Monday encodes lifecycle in groups + a Status column + Notify Trigger + Trigger Status. Replace all of that with one Choice column on the cancellation record:

Plus three terminal/branch states reachable from any point in the pipeline:

### Automation hooks

- On record create with Status = Not Started: Power Automate fires, emails the cancellation owner + terminal compliance contact (replaces Monday "Notify Trigger").
- On Status !' All Items RCVD: app populates "All Items Received Date" and "Tentative Release Date" = today + 45 days.
- On Equipment row update where all required rows = Returned: Status auto-advances to "All Items RCVD".
- On Status !' Released: locks the wizard, generates the cancellation letter notification.

## Field mapping — Monday "Cancellation Return

Every Monday column has a destination, gets dropped, or is replaced by computed logic. The "Notes" column flags any non-trivial decision.

| Monday column                   | New destination                           | Notes                         |
|---------------------------------|-------------------------------------------|-------------------------------|
| Name (Unit Number)              | cr6cd_dix_unitnumber (text)               |                               |
| Status group                    | cr6cd_dix_status (Choice)                 | merged with Status column     |
| Status (color_mksecehw)         | cr6cd_dix_status (Choice)                 | see status pipeline page      |
| Type (status)                   | cr6cd_dix_type (Choice)                   | 10 values; drives conditional |
| Terminal (dropdown)             | cr6cd_dix_agent (lookup)                  | lookup to existing            |
| Motor Carrier (status)          | — derived from agent                      | remove duplication            |
| Division (status)               | — derived from agent                      | remove duplication            |
| Vendor Code/Name                | cr6cd_dix_vendor (lookup)                 | or text fallback if no DIX    |
| Driver Code/Name/Phone          | cr6cd_dix_canceldriver (lookup)           | or text fallback              |
| Trailer Code                    | cr6cd_dix_trailercode (text)              |                               |
| Cancellation Reason             | cr6cd_dix_cancelreason (Choice)           | 10 values: Resigned-Other,    |
| Reason for Leaving (text)       | cr6cd_dix_reasondetails (Memo 2000)       |                               |
| Submitter (people)              | cr6cd_dix_submittedby (lookup systemuser) |                               |
| Owner (people)                  | cr6cd_dix_assignee (lookup systemuser)    | replaces Monday Owner         |
| Start Date                      | cr6cd_dix_startdate (Date)                |                               |
| Cancel Date                     | cr6cd_dix_canceledate (Date)              |                               |
| Entry Date                      | createdon                                 | use Dataverse system field    |
| CXL Due Date                    | cr6cd_dix_duedate (Date)                  | auto = canceledate + 7        |
| All Items RCVD Date             | cr6cd_dix_allitemsrcvddate (Date)         | auto-set on equipment 100%    |
| Tentative Release Date          | — derived                                 | allitemsrcvddate + 45 days,   |
| Days Past Due                   | — derived                                 | computed in UI: today -       |
| Deadline Status                 | — derived                                 | On Time / Past Due,           |
| Notify Trigger / Trigger Status | — DROP                                    | replaced by Power Automate    |
| 10× equipment status columns    | cr6cd_dix_cxl_equipment rows              | see equipment lifecycle page  |
| Equipment % battery             | — derived                                 | returned / needed, computed   |
| 9× "Needed" formulas            | — derived from Type                       | equipment table seeded by     |
| Request Return Label?           | cr6cd_dix_requestreturnlabel (Bool)       |                               |
| Return Label (file)             | cr6cd_dix_returnlabelurl (text)           | store SharePoint URL or       |
| RL Tracking Number              | cr6cd_dix_rltrackingnumber (text)         |                               |
| Provider (formula)              | — derived                                 | detect FedEx/UPS from         |
| Final Release (file)            | — derived                                 | generated PDF stored in       |
| Time tracking (4 columns)       | cr6cd_dix_cxl_event rows                  | derive durations from event   |
| Subitems                        | — DROP                                    | equipment table replaces      |
| Samsara link (board relation)   | cr6cd_dix_samsaralink (text)              | optional; URL only            |

# Equipment sub-table — why we replace 10 columns with 1 relation

Monday has 10 separate status columns: ELD, DashCam, DashCam Cover, Door Signs, IFTA, License Plate, PrePass, Logs, RFID, Trailer Lock. Each shares the same 9-state lifecycle. Adding new equipment means another column, more formulas, more board surgery. The relational pattern fixes this:

## cr6cd\_dix\_cxl\_equipment

one row per piece of equipment per cancellation

```
cr6cd_dix_equipmentkey (text)      e.g., "eld", "dashcam", "ifta"
cr6cd_dix_displayname  (text)      e.g., "ELD"
cr6cd_dix_lifecyclestate (Choice)   Need / Returned / Not Received / Transferred / Damaged / Forfeit / Under Review
cr6cd_dix_returneddate (Date)       when this piece came back
cr6cd_dix_notes        (Memo 1000)
lookup: cr6cd_dix_equipmentcancellation!' cr6cd_dix_cxl_cancellation'
```

## Lifecycle states (shared global choice set)

NeedReturnedNot ReceivedTransferredDamagedForfeitUnder Review

No Longer NeededN/A

## Auto-seeding rule

When a cancellation is created, the wizard inspects Type and seeds equipment rows with sensible defaults:

- Type = "Driver Only" !' seed the personal-equipment items as Need; physical items as Not Received
- Type = "Unit Only" !' seed truck items as Need; driver-personal items as Not Received
- Type = "Vendor/Driver/Unit" !' seed all items as Need.
- Type = "Trailer Only" !' seed Trailer Lock + Door Signs as Need; everything else as Not Received

Ops can override any default. The Equipment % progress bar = (rows with Returned) / (rows with Need + Returned + Damaged + Forfeit + Not Received).

# UI sketches (what ops will actually see)

## Cancellations list page

Replaces today's table with a Kanban-style toggle. Defaults to Kanban; users can switch to Table.

| Not Started                             | In Progress                             | Awaiting Returns                        | All Items RCVD                          | Released                                   |
|-----------------------------------------|-----------------------------------------|-----------------------------------------|-----------------------------------------|--------------------------------------------|
| AT806T01<br>Term 1683 · Driver Only     | AT806T01<br>Term 1683 · Driver Only     | AT806T01<br>Term 1683 · Driver Only     | AT806T01<br>Term 1683 · Driver Only     | AT806T01<br>Term 1683 · Driver Only        |
| AT806T02<br>Term 1684 · Vendor/Driver/L | AT806T02<br>Term 1684 · Vendor/Driver/L | AT806T02<br>Term 1684 · Vendor/Driver/L | AT806T02<br>Term 1684 · Vendor/Driver/L | AT806T02<br>Term 1684 · Vendor/Driver/Unit |

## Cancellation detail — equipment progress

Top-of-step progress bar shows returned vs needed at a glance. Each row is the sub-table.

|                                 |          |                     |
|---------------------------------|----------|---------------------|
| Equipment 40% · 2 of 5 returned |          |                     |
| ELD                             | Returned | returned 2026-04-22 |
| DashCam                         | Returned | returned 2026-04-22 |
| Door Signs                      | Need     | returned 2026-04-22 |
| IFTA                            | Need     | returned 2026-04-22 |
| Plate                           | Damaged  | returned 2026-04-22 |
| PrePass                         | N/A      | returned 2026-04-22 |

# Migration & rollout

## Phase 1 — Schema and table provisioning

- Write scripts/create-cancellation-tables.ps1 (BOM-encoded, follows pulse-tables pattern). Adds new columns to cr6cd\_dix\_cancellation, creates cr6cd\_dix\_cxl\_equipment + cr6cd\_dix\_cxl\_event, defines the global choice set for equipment lifecycle.
- Run: powershell -File scripts/create-cancellation-tables.ps1.
- Register both new tables as data sources via npx power-apps add-data-source. Run pnpm power-apps schema sync.

## Phase 2 — App build

- Rebuild NewCancellation.tsx with 5-step wizard mirroring the New Entry pattern (progressive save, conditional fields, validation per step).
- Replace listing page with Kanban + Table toggle. Reuse existing Search Records UX patterns.
- Implement Cancellation Letter jsPDF generator under src/lib/generateCancellationLetter.ts. Same pattern as the other 14 generators.
- Wire Power Automate flag pattern for owner notification + email draft (proven from Add/Move Email and CP Registration flows).

## Phase 3 — Data migration

- Write scripts/migrate-monday-cancellations.cjs that pulls all 1,101 records from board 9494905327 via Monday GraphQL API, transforms columns to Dataverse fields, and POSTs via the same auth flow as the table-creation scripts.
- Map driver/vendor by code lookup; if no match, store the code as text. Manual reconciliation pass for orphans.
- Migrate equipment columns into per-cancellation cr6cd\_dix\_cxl\_equipment rows. Drop sub-items entirely (they are noise).

## Phase 4 — Cutover

- Enable "New Cancellation" button (remove Coming Soon gate) in DIX prod.
- Set Monday board permissions to read-only and post a banner directing all submissions to DIX.
- Monitor 30 days. Archive Monday boards.

## Time estimate

Phase 1: ½ day. Phase 2: 3-4 days. Phase 3: 1 day for migration script + 1 day for reconciliation. Phase 4: ½ day. Total ~6-7 working days end to end.

## Decisions I need from you before building

### Q1 Drop "Cancel Process" board entirely?

I am proposing yes — it has 1 active item from 2024 and the per-department workflow is not happening anywhere in practice. Confirm.

### Q2 Drop "Cancellation Requests" board entirely?

Same — 1 active item, vestigial. The Returns Tracking form view already supersedes it. Confirm.

### Q3 Keep all 10 equipment types, or also add new ones now?

Current Monday set: ELD, DashCam, DashCam Cover, Door Signs, IFTA, License Plate, PrePass, Logs, RFID, Trailer Lock. Anything else worth adding while we are at it (e.g., Hazmat books, Fuel Card, Insurance Card)?

### Q4 Cancellation reason taxonomy

Monday has: Resigned (Other / Found Another Job / Truck Down / Sick / Personal / Retiring) + Termination (Other / No Contact / Medical / Safety). Same set, or trim/expand?

### Q5 Cancellation letter PDF design

Should I model after an existing template you already use, or create a new layout following our standard ARL/ACT/Partners letterhead pattern (like the CP Letter)?

### Q6 Migration timing

Run migration during business hours with the Monday board frozen for 1 hour, or do it overnight? Either works on the technical side.

### Q7 Owner notifications

Notify on every status change, or only on (a) record created, (b) all items received, (c) released? Notify by email, by Front draft, or both?

### Q8 Audit log table

Optional — do you actually want cr6cd\_dix\_cxl\_event for "who changed status when," or skip it and rely on Dataverse audit logs?

# Appendix — what is in Monday today

## Cancellation Returns Tracking, by status group

| Status group                  | Monday group ID |
|-------------------------------|-----------------|
| Not Started Yet               | topics          |
| In Progress                   | group_title     |
| Awaiting Returns              | group_mksegg3y  |
| Exceptions - Awaiting Returns | group_mksepg5   |
| All Items Received            | group_mksec9a2  |
| Items Not Received            | group_mkse95hd  |
| Transferred                   | group_mksefkz6f |
| Reactivations - No Time Lost  | group_mksefn2r6 |

## Cancellation Type label set

| Type               | Meaning (inferred)                   |
|--------------------|--------------------------------------|
| Vendor Only        | vendor leaves; no driver, no unit    |
| Driver Only        | driver leaves; vendor + unit stay    |
| Unit Only          | unit retired; driver/vendor stay     |
| Vendor/Driver/Unit | full cancellation, all parties leave |
| Vendor/Driver      | driver and vendor leave; unit stays  |
| Vendor/Unit        | vendor and unit leave; driver stays  |
| Driver/Unit        | driver and unit leave; vendor stays  |
| Trailer Only       | trailer cancellation only            |
| SUB Unit           | substitute unit cancellation         |
| Rental Only        | rental unit returned                 |

## Active board owners

Nicholas Valentino · Queen Tatiana · David Truong · Sarah Reisker · Alberto Florez · Anderson Marquez · Maria Melgarejo. These users will see the same Kanban view in DIX — auth roles need to be confirmed before launch.

### Next step

Read this, mark up the decisions on page 11, and tell me which of the 4 phases I should start on. I will not write code or touch Dataverse tables until you give the go-ahead.
